## **CATARACTS: Seeing Beyond the Blur**

Cataracts is any clouding of the human lens and are the leading cause of visual loss in adults age 55 and older and the leading cause of blindness worldwide. By age 65, about half of the human population has a cataract, and by age 75, almost everyone has a cataract. However, cataracts are highly treatable, and through advances in both cataract surgery and intraocular lenses (IOLs), more people are experiencing full restoration of their vision than ever before.

- Is your Vision Blurry?
- Do colors appear dull?
- Are your glasses no longer working?
- Does sunlight or other light seem overly bright?
- Do you have decreased night vision or see halos around lights?

Although stronger eyeglasses or brighter lighting may help relieve symptoms of a cataract in the early stages, surgery is the only cure and the most common form of treatment. In fact, millions of people undergo this vision-saving procedure each year

**If you or someone you love has just been diagnosed with a cataract, or if you would simply like to learn more about cataracts and cataract surgery talk to the Specialists at the Culpeper Surgery Center or visit [www.culpepersurgerycenter.com](http://www.culpepersurgerycenter.com)**
